

Validity of the thesis / project as Complex engineering problem: The complex engineering justification has not been addressed at all. This must be properly understood and the entire section must be written.

Literature review: Too much overlap with introduction correct it.

Methodology and outcomes: Thesis report shows propagation delay 335s, but technology scaling reports 25.5-ns at 180nm, 25.5-ns at 90nm, and 25.5-ns at 45nm, that are different so calculations need to be corrected. 2. Unusual power dissipation for TGL circuits, check the connection. 3. Digital sequence test function verification mismatch.

Presentation: in literature review, use fewer words and provide clear comparison of previous studies.

Methodology -> Explain design steps and setting (simulation) more clearly.

The flowchart is too small to explain the work effectively. Make it larger. Slide 11-13 -> include truth table.
